Reflection Questions:

1. Did your estimations reflect the actual effort?

Yes. The story points were mostly suitable for the effort required. Simple tasks had fewer points, while complex tasks had more points.

2. Was your backlog well-prioritized?

Yes, the backlog was prioritized according to the importance and user impact of the functionality. Core features such as **Search ISBN Catalog**, **Place Book Hold**, and **Receive Holding Notification** were given High priority, while **View Holding Queue** and **Manage Reservations & Holding Queue** were given Medium priority. This allowed the most important functionality to be considered first during sprint planning.

3. How did your simulated sprint align with your plan?

The simulated sprints aligned with our plan because we selected the higher-priority stories for Sprint 1 and completed them by moving them from **To Do → In Progress → Done**. Sprint 1 contained 16 story points and all planned stories were completed. The remaining stories were then handled in Sprint 2, which contained 23 story points and was also completed successfully.

4. What insights did the burndown chart give about your team's capacity?

The Burndown Charts showed that the team completed all the planned work in both sprints, with the remaining work reaching **0 story points**. Sprint 1 started with 16 story points, while Sprint 2 started with 23 story points. The charts helped us compare actual progress with the ideal guideline and understand how much work remained during the sprint.
